From 30th Annual Meeting and Associated Programs of the Society for Immunotherapy of Cancer (SITC 2015) National Harbor, MD, USA. 4-8 November 2015

## Background

Tumor antigen-specific CD4<sup>+</sup> T cells generally orchestrate and regulate innate and adaptive immune cells to provide immune surveillance against malignancy. However, activation of antigen-specific CD4<sup>+</sup> T cells is restricted at local tumor sites where antigen-presenting cells are frequently dysfunctional, which can cause rapid exhaustion of anti-tumor immune responses. Herein, we characterize anti-tumor effects of a unique human CD4<sup>+</sup> helper T cell subset that directly recognizes the cytoplasmic tumor antigen, NY-ESO-1, presented by MHC class II (MHC-II) on cancer cells. In addition, we clone the TCR gene from tumor-recognizing CD4<sup>+</sup> T cells (TR-CD4) and test the function of TCR gene-engineered cells.

## Methods

NY-ESO-1-specific CD4<sup>+</sup> or CD8<sup>+</sup> T cells were obtained from ovarian cancer patients who received NY-ESO-1 vaccine. Full-length TCR  $\alpha$  and  $\beta$  chain genes of TR-CD4 were cloned by 5' RACE PCR. TCR gene was transduced into activated T cells by MSCV-based retroviral vector. The effector function was evaluated against cognate peptide-pulsed target cells or NY-ESO-1<sup>+</sup>MHC-II<sup>+</sup> cancer cell lines by ELISA, intracellular cytokine staining or CTL assay.

## Results

TR-CD4, but not conventional NY-ESO-1-specific CD4<sup>+</sup> T cells, directly recognized cancer cells in MHC-II-dependent and NY-ESO-1-specific manners. Presentation

of intracellular NY-ESO-1 on MHC-II by cancer cells required non-classical MHC-II antigen presentation mechanisms. Upon direct recognition of cancer cells, TR-CD4 potently induced IFN- $\gamma$ -dependent growth arrest in cancer cells. In addition, direct recognition of cancer cells triggers TR-CD4 to provide help to NY-ESO-1-specific CD8<sup>+</sup> T cells by enhancing cytotoxic activity, and improving viability and proliferation. Notably, the TR-CD4 either alone or in combination with NY-ESO-1-specific CD8<sup>+</sup> T cells significantly inhibited tumor growth *in vivo* in a xenograft model. Finally, retroviral gene-engineering of polyclonally activated T cells with TCR derived from TR-CD4 successfully produced large numbers of functional TR-CD4.

## Conclusions

These observations provide mechanistic insights into the role of TR-CD4 in tumor immunity, and suggest that approaches to utilize TR-CD4 will augment anti-tumor immune responses for durable therapeutic efficacy in cancer patients. Large numbers of TR-CD4 that directly recognize cancer cells and enhance CD8<sup>+</sup> T cell functions can be generated by gene-engineering with TCR from TR-CD4. Antigen-presenting cell-independent provision of CD4-help by TR-CD4 is especially important to enhance durable CD8<sup>+</sup> T cell anti-tumor functions at the tumor local site. Adoptive T cell therapy using TR-CD4 in combination with CD8<sup>+</sup> T cells could be a promising strategy for effective eradication of tumors.
